2.1	<p>Presentation by M/s Willowood Chemicals for grant of registration for technical import of Abamectin technical 95.00% w/w min. 9(3) TI.</p>
	<p>A presentation was made by the representative of the applicant stating that the source is registered for 94% min, hence can manufacture Abamectin technical with a purity of 95% or more which can be seen from the data. The representative of the company informed that they have written a letter to the Sectt. of CIB&RC for change of RTT dated 20th February 2017 for which no communication was received by them. It was also observed that the date of filling of application is 29.03.2017 and request for change of RTT is after generation of all data only just before filling of an application.</p> <p>The RC observed that the source in the exporting country has a registration for Abamectin 94% Min purity which might have a different chemical composition other than submitted by the applicant of the Abamectin 95% min. Therefore, the applicant submitted a chemical composition which doesn't exist or registered in the ICAMA in favour of M/s. Synwill Co. Ltd. and the Chemical Composition registered in China doesn't match or applied in India. The RC was appraised that the RC in its 387th meeting has decided as under:</p> <p><i>“For “Technical Import (new source) U/S 9(3)” category, only same or higher purity (% a.i. min.) than the already registered purity (% a.i. min) of the same pesticide technical shall be considered for registration.”</i></p> <p>It implies that lower purity of the same product shall not be granted registration to avoid the dumping of inferior quality into the country.</p> <p>It was also informed by the Sr. Law Officer that mere submission of a communication does not entitle to believe that their request has been approved for transfer of RTT. It was also noticed that the RTT was issued in 2001 from the given below manufacturing address: 46, Waisha Road, Jiaojiang District, Taizhou City, Zhejiang Province, China – 381 000</p> <p>The same was changed from above address to the given below address: 97, Waisha Road, Jiaojiang District, Zhejiang, China – 381 000</p> <p>It shows that the manufacturing address has been changed. It implies that the sample manufactured at 46, Waisha Road, Jiaojiang District, Taizhou City, Zhejiang Province, China – 381 000 was used for data generation and sample was submitted in CIL for PRV verification from another plant i.e. 97, Waisha Road, Jiaojiang District, Zhejiang, China – 381 000</p> <p>The following irregularities were also noticed:</p> <ol style="list-style-type: none"> 1. The RTT was issued on 03.07.2001 for 5 kg of Abamectin. The data of chemistry was generation started from 11.09.2001 to 11.03.2004 with a shelf-life claim of two years. 2. The bioefficacy data generation started August 2009 to July 2010. It shows that the data has been generated on shelf-life expired sample only. 3. As per data submitted by the applicant it shows that M/s. Zhejiang Hisun Chemical Co., Ltd.46, Waisha Road, Jiaojiang District, Taizhou City, Zhejiang Province, China – 381 000 hold a temporary Certificate No. LS97753 valid from 2005.03.04 upto 2006.03.04 of Abamectin 95%, 90% & 75%. The same was not granted permanent registration status, hence stand cancelled (As per ICAMA website) <p>Keeping in view the registered purity of the product in the exporting country the RC decided to reject the application.</p>

- d. **R[#]**: One season / year data generated at minimum four different agro-climatic zones for fungicides, insecticides and PGRs. **Whereas, in case of herbicides, two seasons/years data generated at minimum two agro-climatic zones in case of 9(3b) and two seasons/years data generated at minimum three agro-climatic zones in case of 9 (3).** In case of seed treatment one season / year data generated at minimum three different agro-climatic zones will be required. In case of soil applied Pesticides (Insecticide/ Fungicide/ Herbicide), if residue at harvest is above LOQ then 2nd season data will be required or else one season data will be sufficed.

Note: For commercial non edible crops ((like jute, jatropha, rubber, etc.,) only, the data on residue and persistent is plant is not required.

- e. **R^{\$}**: If Technical Import & Technical Indigenous Manufacture application which are submitted together with Formulation Import & Formulation Indigenous Manufacture applications, no bio-efficacy data required.

Note: In case of herbicides data on effect on soil Physico- chemical and biological properties and effect on normally cultivated three succeeding crops is required along with residue studies in the same plots of the field.

Example: for a herbicide intended to be registered for use in wheat crop data on effect on succeeding crops of maize at location one, green gram at location two and sesamum at location three may be generated along with residue studies. However, this is only an example and data on any other normally cultivated succeeding crop may be generated.

1. For registration of Combination products of two / three registered pesticides (All sort of combination should be addressed in this): data is required as per the guidelines of Formulation Import / Formulation Indigenous Manufacture. However, data on Sr. No. 1, 2 (if any individual component is not registered as formulations, the two seasons comparable data are required to be generated against

target insects/ diseases/ weeds using stable / viable formulations. Already registered formulations of individual component of the formulation at approved dosage shall also be included as check), 4, (required only for insecticides and PGR)10, 11, 12, 13, 14, 15,16,17, 18 & 19 (Table – 1) if the a.i. content of either component of the combination product is higher than the already registered same formulations combinations, the applicant is required to submit the data.

Note: S. No. 14 & 15: Data on residue required for as many seasons and locations as required in case of existing FIM u/s 9(3) guidelines. In case of herbicides data on effect on succeeding crops and soil physico-chemical and biological properties are also required along with residue studies as detailed in existing FIM under section 9(3) bioefficacy guidelines for herbicides.

S. No. 10,11,12,14 & 15: These data shall only be required when the concentration / a.i. dose are higher than already registered and / or in case new compound is formed and / or any adjuvants / diluents (other than water) / carrier is different that are in te registered formulations of the individual components. Data on 12, 14, & 15 are also required for the additional crop label claims to common of the individual registered.

2. If technical is already registered for import under section 9(3) and applicant want to apply for indigenous manufacture of the same pesticide then one season data on Sr. No. 1, & 2 (Table – 1) if any, on two representative crops at two different agro-climatic zones is required and one season residue data on two representative crops particularly on fruits and vegetables is required.
3. If formulation is already registered for import or for indigenous manufacture u/s 9(3) by any applicant and the same registrant want to apply for technical indigenous manufacture, data on Sr. No. 1, 2 & 14 (Table – 1) not required. Whereas, if other applicants want to apply for technical indigenous manufacture, one season data on Sr. No. 1 & 2 (Table – 1) on two representative crops at two different agro-climatic zones is required and one season data on Sr. No. 14 (Table – 1) on two representative crops particularly on fruits and vegetables is required.
4. In case of Technical Import from New Source, two seasons data on each crop mentioned in labels/ leaflets at least at two different agro-climatic Zones is required on Sr. No. 1 & 2 (Table – 1) and two years or seasons data on Sr. No. 14 (Table – 1) on representative crops of each group on which pesticide is approved.

Note: Data on Sr. No. 1 & 2 (Table – 1) is required on all registered formulations of same technical on all approved crops at the time of Issue of import permit provided the application for registration is received within 4 years of issue of import permit.

5. For registration of pesticide formulation for indigenous manufacture having the identical chemical composition that of formulation already registered for import U/s 9(3). No data on bioefficacy is required provided the technical of the source to be used in formulation is duly registered as per guidelines of the Registration Committee and the label claims are same. Whereas, for registration of pesticide formulation for indigenous manufacture having different chemical composition that of formulation already registered for import u/s 9(3), complete data on Bioefficacy to be submitted as per already existing guidelines for formulation indigenous manufacture (FIM) U/s 9(3) provided the technical (source) to be used for making formulation is duly registered as per guidelines of the Registration Committee.

6. In case of Formulation Import without registering technical or Formulation Indigenous Manufacturing without registering technical, in addition to data on formulation, complete bioefficacy data on technical as per the guidelines of Technical Import or Technical Indigenous Manufacture is required.

2. MOU/license agreement between the applicant and the inventor (either own R&D Laboratory or outsourced Research Institute/Facility) or Authorization letter from the inventor of strain OR undertaking by the applicant about the name of inventor/source of strain as per **Annexure-I**
3. Updated Stakeholder list for all members in Association/ Organization claiming for MOU/authorization for data /technology utilization for mass multiplication/commercialization of the strain.
4. Relevant Affidavit/Undertakings:-

- d) Undertaking on NJSP duly notarized that product is free from chemical/botanical pesticides / other agro-chemicals.
- e) Affidavit of strain Innovator or applicant
- f) Copy of 9(3B) Registration certificate, if relevant

Note:

1. Bt products should be labeled with bio potency and (or) toxin content. In addition, the labels will have to contain a measurement of toxin protein as percent protein, referring to the Lepidopteran-active toxin(s) present in the crystal.
2. The presently used Bt var. kurstaki standard is HD-1-S-1980 and its potency was calculated at 16,000 IUs per milligram of powder (Beegle et al. 1986. Standardization of HD-1-S-1980: US Standard for Lepidopteran-active *Bacillus thuringiensis*. Bulletin Ent. Soc. America 32: 44-45.). This standard strain is now available with PDBC, Bangalore and DOR, Hyderabad.
3. Defined potency and toxin concentration – Bioassay would require the use of an insect species. Normally manufacturers could select *Trichoplusia ni* / *Helicoverpa armigera* for Lepidopteran specific Bt formulations. *Spodoptera* Units (SPU), *Leptinotarsa* Units (LTUs) or International Toxin Units (ITUs) are to be used for denoting a specific insect.
4. No test for beta exotoxin is required for *Bacillus sphaericus*, because this species is not known to produce exotoxins.
5. The biopotency of products based on *B. thuringiensis* subsp. *israelensis* (*Bti*) is compared against a reference strain IPS82, 1884 using early fourth-instar larvae of *Aedes aegypti* (strain Bora Bora). The toxicity of IPS82 has an arbitrarily assigned toxicity of 15,000 ITU/mg powder.
6. The biopotency of products based on *B. sphaericus* (*Bsh*) is determined against a reference standard SPH88, strain 2362 using early fourth-instar larvae of *Culex pipiens* (strain Montpellier). The toxicity of SPH88 has an arbitrarily assigned toxicity of 1,700 ITU/mg of the powder (Guidelines for laboratory and field testing of mosquito larvicides, WHO 2005 pp45).
7. The use of alternative bacterial reference powders and / or strains must be approached cautiously. Such alternatives must be the subject of careful cross- calibration against the reference powders and should be conducted by recognized laboratories and should be made available to anyone who wishes to use, or check, the test with the alternative powders/strains.
8. Water content should not exceed 8 %, (12% in *Pseudomonas spp*) to preclude premature degradation of the product.

Storage stability data must be generated keeping at least the following parameters in test protocol viz., temperature, duration, test packaging material, content of active ingredient in the product, test humidity, exposure to light (if applicable), physical and chemical properties of the product during and after storage etc.
6. The testing protocols must have their basis in the WHO/FAO/ CIPAC/ASTM recommendations or other validated methodology of GLP/ NABL accredited laboratory having packaging testing chemical / mechanical as applicable etc.) in the scope.
7. The storage stability data for microorganisms can vary depending on the type of microbes. For Fungi, maximum storage stability study data will be 12 months at ambient temperature. For Gram negative bacteria like *Pseudomonas fluorescens* or other *Pseudomonas* species the maximum storage stability study data should be 8 months at ambient temperature. For spore forming gram positive bacteria like *Bacillus* species the maximum storage stability study data should be 18 months at ambient temperature.

Besides this, the sub-committee also proposes the Guidelines on Consortium of Bio-pesticides.

Guidelines on Consortium of Bio-pesticides.

Efficiency of biocontrol agents could be increased by the development of mixture of compatible strains of different biocontrol organisms by considering the following norms. While developing a consortia formulation, the following needs to be addressed:

1. Compatible strains combination that differs in pattern of plant/site of colonization.
2. Compatible strains combination is broad spectrum of action against different plant pathogens.
3. Compatible strains combination with different modes of action under similar conditions.
4. Compatible strains combination of genetically diverse group to adapt to different pH, moisture, temperature and relative humidity.

The guidelines of Chemistry, Bio-efficacy, packaging for registration of consortia of Bio-pesticides are similar with the guidelines of Bio-pesticides except the following points.

Guidelines of mother culture/Primary culture of already registered bio-pesticides u/s 9(3) category are not required for registration of consortium Bio-pesticides. Only the guidelines of formulated product (Consortium) will be required. **Ratio of each strain in the formulation is required.**

1. Following toxicology guidelines for consortia of Bio –pesticides are required.

Note:

- a. Inhalation toxicity study required for registration of entomopathogenic/entomotoxic bacteria
- b. Pulmonary toxicity study required for registration of antagonistic bacteria, antagonistic fungi, entomopathogenic fungi, baculovirus
- c. Intraperitoneal toxicity study required for registration of antagonistic fungi, entomopathogenic fungi, antagonistic bacteria
- d. Cell culture and Intravenous study required for registration of baculovirus. e and f – required for all except antagonistic fungi
- e. Required for all except entomopathogenic/entomotoxic bacteria

Note:-

- a . If genome sequence of conserved region of the microbial strains/microbes which are used in consortia of Bio-pesticides to be used as microbial pest control agent is identical with already registered strain, then data is not required for mother culture but data is required for combination/consortia from toxicity angle.
- b . If any new formulation of microbes is made by using new ingredients with different processes of manufacture than data is required for the formulation.
- c . If any new combination/consortia /Mixture of microbial strains/microbe developed from already registered microbial strain than data is required only for the mixture and not for mother cultures from toxicity angle.

Appendix-I

Bioassay for plant disease antagonists based on disease severity and root colonization.

The target pathogen to be tested against has to be grown in Sand maize medium. The Sand-maize medium is prepared by adding sand 90g, maize 10g. and water 10ml in a saline or any glass bottle of 300ml capacity and then autoclaved twice. Then 5 mycelial discs of the test pathogen are transferred into the bottle and left for incubation for 15 days. Once the culture has grown well, the sand maize medium is mixed along with the fungal growth and 1g from this preparation is used as the inoculum after adjusting the CFU to 1×10^6 /g by addition of sand.

The plastic cups (5-6 cm diameter) filled with soil and FYM (3:1) have to be used. In each cup the filling should be done upto $\frac{3}{4}$ th level. The pathogen inoculum is mixed with sand has to be applied upto 2cm depth in the plastic cups.

The bio-efficacy of the bio-agent shall be tested by both seed treatment and soil application. For seed treatment, the recommended dose of the formulation has to be used (5 to 10g.). For soil application, the bio-agent is added at the rate of 1g of formulation (minimum CFU should be the 2×10^6). The germination percentage, disease intensity and seedling vigour are to be recorded.

Another set of plastic cups filled with sterile soil and sterile FYM has to be used to confirm whether the bio-efficacy was due to the isolate of the bio-agent tested or due to the native isolates of the bio-agent present in the soil.

The keys for grading the efficacy mentioned below shall be used (Srivastava et al., 2002). However, for the registration purpose, the bio-agents that are Highly Efficient, Efficient or Moderately Efficient in the plastic cup test under glass house condition (in the presence of pathogen) can be allowed (i.e.) germination percentage of 70% or above, disease incidence of 30% or less can be considered for registration.

Disease Grading Key

Disease incidence (%)	Description	Rating of bio-efficacy of bio agents
0	Germination >90%, no seed rotting, seedling healthy, root and shoot portions well developed	Highly Efficient (HE)
1-15	Germination 80-90%, infection on main as well as lateral roots, seedlings are well developed	Efficient (E)
16-30	Germination 70-80%, development of roots restricted and growth is less compared to Score 1. Infection occurred on roots. Shoot portions developed but growth retarded compared to Score 1.	Moderately Efficient (ME)
31-45	Germination 60-70%, length of roots and shoots short compared to Score 1. Germination of seeds inhibited. 50% of root area infected. Shoot portions also showed infection	Moderately Inefficient (MI)
46-60	Seed germination 50-60%. Development of roots and shoots greatly retarded. Shoot portions also showed infection.	Efficient (I)
Above 60	Less than 50% germination and seed rotting	Highly Inefficient (HI)

For the root colonization assay, the rhizosphere region of the plants tested above have to be collected and the soil adhering to the root surface has to be removed by gently tapping the roots. The root bits have to be cut into 1 cm bits and randomly 25 bits should be selected for each treatment. They have to be plated on (TSM) and the percentage of root bits colonized has to be recorded. This has to be performed in the sterile soil and non-sterile soil. One control treatment without the Biocontrol agent, being tested, should be kept for both the sterile and non-sterile soil to rule out of the possibility of interference of native micro flora in the bio- efficacy assay.

The sand-maize medium is prepared by adding sand 90g, maize 10g and water 10 ml in a saline or any glass bottle of 300ml capacity and then autoclaved twice. Then 5 mycelial discs of the test pathogen are transferred into the bottle and left for incubation for 15 days. Once the culture has grown well, the sand maize medium is mixed along with the fungal growth and 1 g from this preparation is used as the inoculum after adjusting the cfu to 1×10^6 by addition of sand.

The plastic cups (5-6 cm diameter) filled with soil and FYM (3:1) have to be used. In each cup the filling should be done upto $\frac{3}{4}$ th level. The pathogen inoculum is mixed with sand has to be applied upto 2 cm depth in the plastic cups.

The bio-efficacy of the bio-agent can be tested by both seed treatment and soil application. For seed treatment, the recommended dose of the formulation has to be used (5 to 10g). For soil application, the bio-agent is added at the rate of 1g of formulation (minimum cfu should be the 2×10^6 , the CIB recommended dose). The germination percentage, disease intensity and seedling vigour are to be recorded.

Another set of plastic cups filled with sterile soil and sterile FYM has to be used to confirm whether the bio-efficacy was due to the isolate of the bio-agent tested or due to the native isolates of the bio-agent present in the soil.

The keys for grading the efficiency mentioned below can be used here (Srivastava et al., 2002). However, for the registration purpose, the bio-agents that are Highly Efficient, Efficient or Moderately Efficient in the plastic cup test under glass house condition (in the presence of pathogen) can be allowed (i.e.) germination percentage of 70% or above, disease incidence of 30% or less can be considered for registration.

Disease Grading Key

Disease incidence (%)	Description	Rating of bio-efficacy of bio-agents
0	Germination >90%, no seed rotting, seedling healthy, root and shoot portions well developed	Highly Efficient (HE)
1-15	Germination 80-90%, infection on main as well as lateral roots, seedlings are well developed	Efficient (E)
16-30	Germination 70-80%, development of roots restricted and growth is less compared to Score I. Infection occurred on roots. Shoot portions developed but growth retarded compared to Score I.	Moderately Efficient (ME)
31-45	Germination 60-70%, length of roots and shoots short compared to Score I. Germination of seeds inhibited. 50% of root area infected. Shoot	Moderately Inefficient (MI)

	portions also showed infection	
46-60	Seed germination 50-60%. Development of roots and shoots greatly retarded. Shoot portions also showed infection.	Inefficient (I)
Above 60	Less than 50% germination and seed rotting	Highly Inefficient (HI)

For the root colonization assay, the rhizosphere region of the plants tested above have to be collected and the soil adhering to the root surface has to be removed by gently tapping the roots. The root bits have to be cut into 1 cm bits and randomly 25 bits should be selected for each treatment. They have to be plated on TSM and the percentage of root bits colonized has to be recorded. This has to be performed in the sterile soil and not sterile soil. One control treatment without the biocontrol agent being tested should be kept for both the sterile and non-sterile soil to rule out the possibility of interference of native microflora in the bio-efficacy assay.

For the bacterial antagonists, the above bioassay procedure has to be followed where only the % root colonization will be considered and other parameters are not required. The % root colonization required is 80%.

Bioassay procedure for *Plutella xylostella*

Various concentrations of *Beauveria bassiana* formulation ranging from 6×10^8 to 2×10^{10} are to be screened to assess the mortality.

Fresh undamaged radish leaves free from pesticide application are to be collected and washed thoroughly in sterile distilled water and air-dried. Individual leaves are dipped in respective concentrations for 30 seconds. After complete drying of leaves ten late 2nd instar larvae of *Plutella xylostella* are released per treatment. A water dipped radish leaf is maintained simultaneously as control.

To prevent desiccation of leaves, the petiole is covered with a moist cotton swab. Each treated leaves are placed in a plastic container of dimension 12.5 x 10 cm containing moist filter paper, Whatman No.41 to provide humidity.

Each treatment has to be replicated thrice. Fresh radish leaves were provided as feed at 24 hours interval. This set up has to be maintained at $25 \pm 1^{\circ}\text{C}$ and 70-80% RH for 7 days. Observations on larval mortality are to be made at 3, 5 and 7 days after treatment.

Appendix I**Bioassay Method****Diet incorporation**

The following protocol is used for diet incorporation of oral toxicants to test their toxicity on target insects. The example presented here is to bioassay Cry I Ac on *H. Armigera* (First instar larva of other test insects are used for similar bioassay).

1. Pipette out 3 ml of the solution into a 40 ml plastic cup.
2. Pour lukewarm diet, approx. 60⁰ C, into the cup to a total volume of 30 ml. Place the lid and shake the cup vigorously for a minute to mix properly.
3. Pour the diet to 0.5 cm height, into wells of a 24-cell insect- rearing tray. Allow the diet to cool in laminar airflow under UV lamps for 1 h to surface sterilize the diet.
4. If concentration of the toxicant in the stock solution was 2 µg/ml, the final concentration in the diet would now be 0.2µg/ml diet. Thus the final concentration of toxin in diet was diluted 10-fold.
5. Release first instars into the diet rearing trays at the rate of one per well. Cover the diet tray with semi-permeable wrap and close the lid.
6. It is recommended that the lid be tightly secured to the tray with rubber bands, to prevent the larvae from escaping. Because the diet is unsuitable, larvae try constantly to escape from the diet rearing trays.
7. Keep controls with larvae released on untreated diet, for all the experiments.
8. The unused rearing trays with diet can be stored in a refrigerator for a week.
9. Change the diet for the larvae every two or three days.
10. Record mortality observations at 8 hourly intervals until the end of seven days, for median lethal time LT₅₀ calculations. LT₅₀ is the time at which 50 % of the test population is killed with the specific dose tested. A simple linear regression equation can be worked out to calculate the LT₅₀
11. Otherwise, record mortality at alternate days until the end of seven days, for median lethal concentration LC₅₀ calculations. LC₅₀ is the concentration that kills half the test population.
12. Record weights of surviving larvae at the end of seven days, for median effective concentration EC₅₀ and LC₅₀ is the concentration that prevents half the test population from reaching 50% of the weight attained by control larvae. For example, if the average weight of larvae on the control diet (without toxin) was 80 mg, EC₅₀ represents the concentration at which 50% of the test population is unable to gain a weight more than 40 mg. LC₅₀ is the concentration that inhibits half the test population from reaching the third instar.

Diet incorporation for filter paper bioassays

1. For bioassays with bollworms, 10 ml toxin incorporated diet is poured over a 16 sq cm piece of filter paper. The filter papers layered with diet are cooled and cut into smaller squares of 2 x 2 cm, and 10 first instar larvae are released in small plastic cups 3 x 3 cm (d x h) cups containing a square. Change the strips every alternate day.
2. Record mortality observations until the seventh day.

Surface coating of semi-synthetic diet

1. Prepare the diet and pour it into the trays or the rearing plastic cups. Generally, 10 µl of the toxin can be used to coat 1 sq cm surface area. Gently swirl the diet surface to ensure uniform and complete spread of the solution over the diet surface.
2. Allow the surface to dry in a laminar airflow under UV light for 2-3 hours to surface sterilize.
3. Release one first instar *H. armigera* larva per well. Always maintain proper controls with untreated diet.
4. Change the diet on alternate days and record mortality until the seventh day. Then, weight of surviving larvae should be recorded on the final day of the bioassay.

The method has the advantage of obtaining constantly reliable results because the toxin is unlikely to be affected by either improper mixing or heat as can occur in the diet-incorporation method. Moreover, less amount of the toxin is required for the assay, compared to the diet-incorporation method.

Exotoxin determination by PCR studies

Methodology:

Some *Bacillus thuringiensis* strains secrete type I β - exotoxin, which is a non-specific insecticidal and thermostable adenine nucleoside oligosaccharide. Toxicity bioassays and HPLC are traditional methods for detecting β -exotoxin. For rapid approach for prediction of type I β -exotoxin production, PCR-based method can be followed as per Diego H Sauko *et al.* (2014). One of these ORFs encodes the Exo protein that was proved to be responsible for the phosphorylation of a β -exotoxin precursor at the last step of their biosynthesis process (Liu et al., 2010). Primers BEF (forward; 50- CGGCAGCCGTTTATTCAAA-30) and BER (reverse; 50- CCCCTTCCCATGGAGAAACA-30) amplify a 406-bp DNA fragment of *thuE* between nucleotides 373 and 778. All *B. thuringiensis* strains are grown on nutrient agar plates for 16h. A loopful of cells is transferred to 100 μ l H₂O and boiled for 10 min to make DNA accessible for PCR amplification. The lysate is centrifuged briefly (5 s at 20,000g), and 5 μ l supernatant is used as a DNA template in each polymerase chain reaction. This is performed with a final volume of 25 μ l containing 2.5 μ l 10x reaction buffer, 0.5 μ l 50 mM MgCl₂, 0.5 μ l 100 mM deoxynucleoside triphosphate mixture, 8 pmol each primer, and 1 U of Taq polymerase (Invitrogen). The PCR amplification consisted of DNA denaturation at 94°C for 2 min followed by 25 cycles of amplification with a gradient thermocycler. Each cycle consisted of a denaturation step at 94°C for 1 min, an annealing step at 54°C for 1 min, and a chain elongation step at 72°C for 1 min. The final elongation step was extended for an additional 5 min. Subsequently, 10 μ l PCR product is analysed by 1.0% agarose gel electrophoresis. A positive control can be also used for better results.

Appendix-I**COUNTING OF NPV/GV (POB/CAPSULE) USING IMPROVED NEUBAUER HAEMOCYTOMETER COUNTING CHAMBER.**

A haemocytometer is used for estimating of NPVs/GVs in a unit volume of the product. The Improved Neubauer Haemocytometer comprised a thick glass slide with a shallow depression in the central section divided into two halves (figure-1). Each side, the base of the depression has a fine ruled grid of squares (figure-2) which is visible under a microscope. The dimensions of this grid are defined. Place a standard cover slip placed over the depression and a one half halves of the slide chamber using a micro pipette. The particles require 2-5 minutes to sediment to the chamber floor.

Either dark field or a phase contrast microscope is used to identify and count polyhedral occlusion bodies (POB) or capsule. With the counting chamber under the microscope, the number of Polyhedra/capsule in a given number of grid squares can be counted. Each count consists of a tally of the number of polyhedra completely contained within a big square plus the number of touching the top and left sides. Polyhedra touching the bottom and right sides are not counted. Since both the depth of the chamber and the grid dimensions are known. It is then a straight forward calculation to determine the number of polyhedra /capsule per ml of test suspension.

Number of NPV (POB) per ml/gm = $\frac{D \times X}{N \times K}$

N x K

Where:

D = Dilution factor

X = Total number of polyhedra

counted N = Number of squares
counted

K = Volume above one small square in $\text{cm}^3 = (2.5 \times 10^{-7} \text{cm}^3)$

Area of each small square is $1/400 \text{ mm}^2 = 0.0025 \text{ mm}^2$. Depth of chamber is 0.1mm. Volume of liquid above a single small square is $0.0025 \text{ mm}^2 \times 0.1\text{mm} = 0.00025 \text{ mm}^3$. To covert to cm^3 multiply by 1/1000 to get a volume of $2.5 \times 10^{-7} \text{ cm}^3$ above 1 small square. Hence, $K=2.5 \times 10^{-7} \text{ cm}^3$

Worked example:

Suppose in a sample diluted by a factor of 1000 we count 535 polyhedra in 160 small squares then:

$$D = 1000$$

$$X = 535$$

$$N = 160$$

$$K = 2.5 \times 10^{-7} \text{ cm}^3$$

$$1000 \times 535$$

$$\text{Thus, POB count} = \frac{1000 \times 535}{160 \times 2.5 \times 10^{-7}} = 1.34 \times 10^{10} \text{ POB/ml of test sample}$$

$$160 \times 2.5 \times 10^{-7}$$

Note: (i) Usually, this procedure is repeated 3 times and an average taken to get a more accurate estimate.

(ii) Same procedure will be used for GV also for counting the number of capsule per unit volume of the product.

Bioassay for GV against *Chilo infuscatellus*

Determination of LD50:

To determine the LD50 of the GVs, third instar larvae should be used. The larvae are to be microfed (one micro litre per larva) with six different doses, viz. 1.1×10^1 , 10^2 , 10^3 , 10^4 , 10^5 , and 10^6 IBs/larva. One hundred freshly moulted larvae have to be used for each treatment. Larvae fed with equal quantity of distilled water serve as control. The mortality has to be recorded daily. The LD50 of the virus is determined following the probit analysis method (Finney,1962).

LD50 = $< 1 \times 10^3$ OB for third instar larvae by micro-feeding.

2. PxGV (containing 0.01per cent Triton X 100) of different concentrations 28000, 2800, 280, 28, 2.8 OB/mm² on the leaf disc) is prepared

4. Air dry these leaf discs for 2-3minutes
5. Repeat the same on the lower surface of the leaf disc.
6. Control discs were treated with distilled water containing 0.01 per cent Triton X 100 only.
7. The leaf discs are placed in Petri dishes lined with wet filter paper discs and 35-second instar larvae of *P. xylostella* (starved for 6 hours) are released on each leaf disc starting from control treatment to highest concentration. This is replicated three times.
8. Incubate these larvae at 25^oC
9. After 24 hours remove the treated leaves (partially eaten) and provide the larvae with fresh cauliflower leaves.
10. The leaves are changed daily and mortality data recorded everyday.
11. The dosage and time mortality responses are subjected to probit analysis.
12. If the mortality in the control excess 10% repeat the experiment.

Laboratory bioassay procedures for estimation of LC50 of *Achaea janata* Granulosis virus (AjGV) by leaf disc method:

1. Cut leaf discs of castor (8cm dia) and wash in distilled water. Air dry these leaf discs for 5minutes.
2. Treat the leaf disc on both the upper and lower surfaces with 200 µl suspension of AjGV (containing 0.02% Tween-80) of different concentrations (5×10^8 , 5×10^7 , 5×10^6 , 5×10^5 , 5×10^4 corresponding to 19884, 1988, 198, 19, 1.9 OB per mm^2 on the leaf disc)
3. Aliquots of 100 µl of each concentration of GV is first dispensed on the upper surface of the leaf disc and spread uniformly with a blunt end of glass rod (use separate tips and glass rods for each treatment)
4. Air dry these leaf discs for 5minutes
5. Repeat the same on the lower surface of leaf disc
6. Control leaf discs were treated with distilled water containing 0.02% Tween-80only
7. The leaf discs are placed in Petri dishes (9.0cm dia) line on wet filter paper discs and 35 second instar larvae (third day after hatching) of *A. janata* are released on each leaf disc starting from control treatment to highest concentration. This is replicated three times.
8. Incubate these larvae at 25°C.
9. After 24-48 hours remove the treated leaves (partially eaten) and provide the larvae with fresh castor leaves
10. The leaves are change daily and mortality data recorded everyday
11. The dosage and time mortality responses are subjected to probit analysis
12. If the mortality in the control exceeds 10% repeat the experiment.

Recommended LC50 GV (*Achaea janata*) – $LC50 < 4 \text{ OB}/\text{mm}^2$ for second instar larvae by the leaf disc method.

The Data Requirements for Botanical/ Plant origin Pesticides .

II: Plant Based Products

Botanical Pesticides/Pesticides of any Plant Origin like Eucalyptol, Cymbopogon formulation, Neem Based Pesticides, Pyrethrum Extract & Rotenone for Pisci-culture (Formulation)] & Essential Oils (formulations only).

General Guidance

1. It is clarified that traditional remedies or products prepared by the individuals for their own-selfuse do not need registration if the produce is not sold. If the product prepared or the treated produce is to be sold in the market, then the registration is required under the provisions of the Act.
2. Sometimes the active substances to be used as Plant origin or botanical bio-pesticides, are vastly studied and the information of good quality which is consistent with current methodology, information/data is available, then waivers for submission of certain data, if justified, can be granted. Further, in some cases, based on the information and characteristics or the results of studies, additional data may be required.
3. For registration of extract u/s 9(4): It shall be obtained from the same part of the plant with same process of extraction and should have identical chemical composition as of 9(3) registrant.
4. Formulation to be registered u/s 9(4) should have identical chemical composition and required to be prepared from the extract already registered under the Act for use in the country.

The terms used in the report are defined in APPENDIX- II

1. **Active ingredient:** The part of the product that provides the pesticidal action.
2. **Applicant:** The party (manufacturer, importer or their representative) that makes an application for registration of a pesticide to the responsible authority.(Please refer to Form-1 foot note under the Insecticide Rule 1971)
3. **Bio-pesticides :** Biopesticides is a generic term generally applied to a substance derived from nature, such as a microorganic or botanical or semiochemical that may be formulated and applied to control the pest and diseases.
4. **Contaminant or impurity in MPCA:** Any microorganism or substances it produces that are present in a product, other than the specified microorganism (or substances it

produces) of the microbial pest control agent (MPCA); an alternate/mutant form of the MPCA is considered to be a microorganism impurity.

5. **Equivalence** : The determination of the identical similarity of the purity, impurity and toxicological profile as well as of the physical and chemical properties, presented by supposedly similar technical material originating from different manufacturers/place.
6. **Formulation:** The combination of various ingredients in order to render the product useful and effective for the purpose claimed in the manner recommended.
7. **Good Laboratory Practice (GLP):** A quality system concerned with the organizational process and the conditions under which non-clinical health and environmental safety studies are planned, performed, monitored, recorded, archived and reported.
8. **Herbicide**, an agent, usually chemical, for killing or inhibiting the growth of unwanted plants, such as residential or agricultural weeds and invasive species.
9. **Household pesticides** are commonly used indoors to control pests such as ants, cockroaches, houseflies, mosquitoes, fleas, ticks, bedbugs, termites, rodents, mites and microbes. ... Household pesticides may contain one or a combination of active ingredients of synthetic (chemical) or natural (plant or microorganism) origin.
10. **“Import”** means bringing into any place within the territories to which this Act extends from a place outside those territories;
11. **Infective or Infectivity:** The ability of a microorganism to invade and persist in a viable state and to multiply within or on an organism, with or without disease manifestation. The nature of an infection can vary widely with respect to severity, location and number of organisms involved
12. **“Insecticide”(Pesticide)** means - -
 - i) Any substance specified in the Schedule; or

- ii) Such other substances (including fungicides and weedicides) as the Central Government may, after consultation with the Board, by notification in the Official Gazette, include in the Schedule from time to time; or
 - iii) Any preparation containing any one or more of such substances.
- 13. “Label”** means any written, printed or graphic matter on the immediate package and on every other covering in which the package is placed or packed and includes any written, printed or graphic matter accompanying the insecticide.
- 14. “Manufacture”** in relation to any insecticide, include :-
- i) Any process or part of a process for making, altering, finishing, packing labeling, breaking up or otherwise treating or adopting any insecticide with a view to its sale, distribution or use but does not include the packing or breaking up of any insecticide in the ordinary course of retail business; and
 - ii) Any process by which a preparation containing an insecticide is formulated.
- 15. “Package”** means a box, bottle, casket, tin, barrel, case, receptacle, sack, bag, wrapper or other thing in which an insecticide is placed or packed.
- 16. Pathogenicity:** The ability of a microorganism to cause disease and/or inflict damage on the host. Many pathogens cause disease by a combination of (i) toxicity and invasiveness or (ii) toxicity and colonizing ability. However, some invasive pathogens cause diseases that result from an abnormal reaction of the host’s defense system.
- 17. Pesticide product:** The formulated product (pesticide active ingredient(s) and co-formulants) in the form in which it is packaged and sold.
- 18. Plant growth regulators (PGRs)** are chemicals used to modify plant growth such as increasing branching, suppressing shoot growth, increasing return bloom, removing excess fruit, or altering fruit maturity.
- 19. Plant extract/concentrate:** a botanical substance produced from the defined source(s) and by the described manufacturing processes, and which is the “active substance”. For botanical active substances, the extract will be in most cases a mixture of components from the plant and in addition all components that result from the cultivation, harvest,

post- harvest storage and primary processing and manufacturing. It may be difficult to identify and characterize all individual components. Some of these components may be considered as components of concern which may be considered in the same way as “relevant impurities” in chemical pesticide.

- 20. Post-harvest** :In agriculture, postharvest handling is the stage of crop production immediately following harvest, including cooling, cleaning, sorting and packing etc.
- 21. Public Health pesticides:** Pesticides that are used in the control of pests of public health significance under public health programs in the country.
- 22. Registration Dossier:** The set of data that is submitted by applicants, in a structured manner, in support of their application for registration. as per the requirements of the registration committee.
- 23. Semiochemicals:** Chemicals emitted by a plant or animal that evoke a behavioral or physiological response in another organism. When the semiochemical affects an individual of the same species, it is called a ‘pheromone’. When it affects an individual of a different species, it is called ‘allelochemical’.
- 24. Technical material:** Technical-grade materials and technical concentrates; also known as technical-grade active ingredient (TGAI).

Technical grade of MPCA: Microbial material used for manufacture of microbial pest control products. It is the purest preparation of the MPCA resulting from a typical production process, and contains no additives except for purposes of MPCA growth or replication, or typical purification and preparation. It may be commercially distributed to manufacturers of microbial pest control products either in its pure form or augmented with preservatives, stabilizers, and diluents; or it may be a hypothetical stage in the manufacture of the microbial pest control product.
